-Our project is about a car showroom management system

The Car Showroom Management System (CSMS) is a software solution designed to streamline and automate the daily operations of a car showroom. The system helps manage car inventory, customer information, sales records, and invoice generation efficiently and accurately. By replacing manual paperwork with a centralized digital system, the CSMS reduces human errors, improves data accessibility, and enhances overall productivity. The project provides a user-friendly interface for employees and administrators to easily add, update, and track cars, manage customers, record sales, and generate detailed reports that support better decision-making.

- The tasks will be delivered on time, and we will present something good to apply what we are learning.
